

Lab 01 Report

How did you come up with this code? (You can write in simple text or pseudo algorithm form)

The code

- I came up with this code by using Assembly language to create two variables to hold strings. I then asked the user to input the strings of their choice. Once the strings were stored I began a loop using the xor operation. I then computed the hamming distance between both strings. I computed the result and printed it. I then exited the program.

The output (You can print screen and attach them in your report)

```
[ndemory1@linux5 hamminglab]$ ./a.out
Enter first string:foo
Enter second string:bar
Hamming Distance: 8
[ndemory1@linux5 hamminglab]$
```

○

You should show at least one output result from a custom input

```
Hamming Distance: 8
[ndemory1@linux5 hamminglab]$ ./a.out
Enter first string:boo
Enter second string:bob
Hamming Distance: 3
[ndemory1@linux5 hamminglab]$
```
